

# Barriers to Health and Housing in Houston Communities

Improving health outcomes in diverse communities is contingent upon increasing representation in the complete research processes – from data collection to analysis. While there are several barriers to conducting or participating in research for underrepresented groups, certain methods, such as community-based participatory research (CBPR), present solutions to celebrate and support creative collaboration towards progress.

The University of Houston Community Health Worker Initiative (CHWI) complements the goals of CBPR by utilizing a data-guided approach to inform responsive engagement.

I analyzed mixed-methods CHWI data from a sample of 123 respondents to explore potential interventions that could appropriately, effectively, and positively impact the community.
